## **Abstract**

In order to determine the nature and extent of interregional interaction during the Early Formative period at Etlatongo, in the Nochixtlán Valley of Oaxaca, México, 207 obsidian samples have been sourced to determine the origin of each fragment. The results document that the ancient villagers utilized obsidian from nine sources, with the majority (65%) coming from the Parédon source, in Puebla. Differences in types of obsidian and frequencies between different contexts at Etlatongo show selective participation in various networks by the Early Formative villagers. These data contrast with those from Early Formative sites in the Nochixtlán Valley and the Cuicatlán Cañada, where the majority of obsidian comes from Guadalupe Victoria, Puebla. In order to understand changes through time, 106 Late Formative obsidian fragments from Etlatongo were sourced. Seven sources were utilized. While the Paredón source still maintained great importance, other sources comprised a larger portion of the sample than earlier, while several new sources were exploited. Samples from the Valley of Oaxaca and the Isthmus of Tehuantepec provide comparative data on Late Formative obsidian utilization. These data are crucial for understanding interaction and social complexity in the Mixteca Alta and beyond.

## **Resumen**

Con el fin de determinar la naturaleza y extensión de la interacción regional durante el Formativo Temprano en Etlatongo, en el Valle de Nochixtlán de Oaxaca, México, se han utilizado 207 muestras de obsidiana como fuente para determinar el origen de cada fragmento. Los resultados evidencian que los antiguos habitantes de la localidad utilizaban obsidiana de nueve fuentes diferentes, de las cuales la mayoría (65%) proviene de la fuente de Paredón, en Puebla. Las diferencias entre los tipos de obsidiana y las frecuencias entre los diferentes contextos de Etlatongo muestran la diferente participación de varias redes de producción por parte de los habitantes del Formativo Temprano. Esta información contrasta con aquella de los sitios del Valle de Nochixtlán y de la Cañada de Cuicatlán del Formativo Temprano, donde la mayor parte de la obisidiana provenía de Guadalupe Victoria, Puebla. A fin de entender los cambios ocurridos a través del tiempo, se utilizaron 106 fragmentos de obsidiana de Etlatongo como fuente. Se usaron siete fuentes diferentes. Mientras que el sitio de Paredón aún mantenían su importancia como fuente, otras zonas comprendieron una porción más grande de muestras que antes, en tanto que otras nuevas fuentes pasaron a ser explotadas. Los datos se comparan con muestras del Valle de Oaxaca y del Istmo de Tehuantepec. Esta información es crucial para poder entender la interacción y la complejidad social de la Mixteca Alta y más allá.

## Introduction

The Mixtec people achieved a remarkable cultural florescence in the half millennium prior to the Spanish invasion. Because so little is known of prior Mixtec cultural developments, this area often appears isolated from processes throughout Mesoamerica. Given the abundant evidence for interaction throughout the modern state of Oaxaca and Central México in the final centuries of prehispanic Mixtec culture, interregional interaction during the Formative period (approximately 1500 B.C.–A.D. 100) largely remains unsupported by firm data – such as those generated by compositional analysis of obsidian, a volcanic glass crucial in ancient Mesoamerica.

I directed a project to explore intra- and interregional interaction in two phases established by the Mixteca Alta ceramic sequence within the Formative period: (1) the Cruz B phase (1150–850 B.C.), a time when interaction among early villages intensifies throughout Mesoamerica and (2) the Yucuita phase (500–200 B.C.), encompassing the initial portion of the Late Formative, when the first urban settlements appear in both the Mixteca Alta and the adjacent Valley of Oaxaca. The goal of the project was to explore the participation of Formative period Mixtecs in larger Mesoamerican interaction and exchange networks through compositional analysis of obsidian. While the project focused on the Nohchixtlán Valley site of Etlatongo, samples were analyzed from sites beyond this village to understand in which networks these villagers participated. With the aid of a grant from FAMSI, the project sourced 365 obsidian samples and provides new data to examine how this raw material moved throughout a region where it does not naturally occur. By analyzing samples from two different time periods, it is possible to determine diachronic changes in procurement patterns within the Mixteca Alta.

## Background: The Mixteca Alta and Etlatongo

The Mixteca Alta lies in the southern highlands of Oaxaca, México (see [Figure 1](#)). Located at 2,000 meters above sea level, the Nohchixtlán Valley is the largest valley in this mountainous region. The Mixteca Alta served as the crucible for the development of the rich and varied Mixtec culture, best known for the system of competitive city-states referred to as cacicazgos at the time of the Conquest. Early developments in Mixtec culture – particularly during the Formative period – remain poorly understood. Scholars often interpret this dearth of knowledge as a sign that the Mixtec Alta remained uninvolved in many of the cultural developments occurring across Mesoamerica.

Indeed, scholars often contrast the Valley of Oaxaca and the Mixteca Alta, referring to the latter as "peripheral" to larger pan-Mesoamerican developments (Marcus 1989).

Figure 1. Important Archaeological Sites and Obsidian Sources in Formative Mesoamerica.

In order to explore early social complexity and interregional interaction in the Nochixtlan Valley, I conducted fieldwork in 1992 at the site of Etlatongo, located north of the confluence of two rivers, approximately 10 km south of Yucuita. Previously known only from several test units (Zárate Morán 1987), I directed surveying, mapping, and much more intensive excavations at Etlatongo. I have argued that the results of the excavation indicate the Mixtecs' role in Formative prehistory must undergo substantial revision (Blomster 1998, 2004). Analysis of obsidian provides one line of evidence on ancient interaction at Etlatongo.

### Instrumental Neutron Activation Analysis of Obsidian

Obsidian fragments were excavated from culturally meaningful contexts (e.g., storage pits, middens, etc.) at Etlatongo. Obsidian, the sharp edge of which made it crucial to the daily lives of ancient Mesoamericans, has proven extremely useful to archaeologists examining ancient exchange because archaeological fragments can be linked to the

actual obsidian sources throughout Mesoamerica. Obsidian sources quarried by Mesoamericans have been identified throughout México and Guatemala in two major zones of volcanism (see [Figure 1](#)). An ongoing project directed by Michael Glascock at the University of Missouri Research Reactor (MURR) has been to characterize these sources through Instrumental Neutron Activation Analysis (INAA); chemical "fingerprints" have been developed for approximately forty obsidian sources throughout Mesoamerica (Glascock *et al.* 1994:29). Because the chemical variability is greater between obsidian sources than within a single source, obsidian fragments retrieved from archaeological excavations can be matched to specific sources (see [Figure 2](#)).

**Figure 2. Obsidian from different sources found in EA-2 at Etlatongo.**

In order to explore Cruz B interaction at Etlatongo, I initially conducted a trial project that employed INAA on a sample of 45 obsidian artifacts (Blomster and Glascock 2002). Large pieces were selected from three Cruz B contexts at Etlatongo. All obsidian fragments from these three contexts were successfully tied to a surprisingly high number of sources – seven (see [Appendix 1](#)). Of direct relevance to the nature of the relationship between the Nochixtlán Valley and the Valley of Oaxaca, the frequencies of the sources utilized at Etlatongo differ substantially from contemporaneous Valley of Oaxaca villages, where the majority of obsidian came from Otumba, Guadalupe Victoria, and West México. At Etlatongo, Paredón, Puebla (in the Basin of México),

provided the majority of samples. The data also showed synchronic variation in the obsidian sources utilized in the three contexts at Etlatongo.

## **Intra- and Interregional Interaction: Diachronic and Synchronic Data**

As stimulating as the trial project data were, the interpretive power of this small sample without comparable material from elsewhere in the Mixteca Alta remained limited. Thus, with the assistance of FAMSI, a much larger sample was sourced through INAA from both the Cruz B and Yucuita phases at Etlatongo. In addition to more samples from Etlatongo, I collaborated in obtaining samples from sites excavated by other archaeologists throughout Oaxaca state. The sample analyzed by MURR now includes 410 obsidian fragments; an additional sample (ET195; see [Appendix 1](#)) was revealed to be chert, not obsidian, and will not be further discussed.

### ***The Larger Cruz B sample from Etlatongo***

Combined with the initial 45 samples, a total of 207 Cruz B obsidian fragments have been sourced by INAA. Rather than biasing the sample by selecting only certain obsidian fragments from each context, all obsidian fragments from discrete archaeological features and strata were analyzed in order to understand different consumption choices at Etlatongo. The following contexts are employed:

The majority of Etlatongo obsidian samples ( $n = 128$ ) derive from the earliest occupations explored during the 1992 project. A series of features and surfaces, representing several occupations, are here grouped under the term EA-2 (Excavation Area 2), a 5 × 7 meter unit that exposed a series of houses that, based on both architectural and ceramic features, I have interpreted as higher status.

Unit 22, located along the eastern edge of the southern portion of the site, exposed a Cruz B surface with an associated bell-shaped pit (Feature 3) – the largest known from Etlatongo. All 37 obsidian fragments from Feature 3 were analyzed through INAA. The amount of exotic goods and ritual paraphernalia also suggest the residents were of higher status.

Unit 1, placed on the southern-most mound at Etlatongo, exposed a series of strata that elevated several surfaces in what I have identified as a possible public space at Etlatongo. A total of 28 obsidian fragments came from the earliest modifications of this space and were analyzed by INAA.

Units 15 and 16 exposed a series of Cruz B occupations. Those of Unit 15 appear to be of average status, while those revealed by Unit 16 are best categorized as higher status. The few obsidian fragments that came from these contemporaneous deposits were analyzed with INAA: 8 from Unit 15, 6 from Unit 16.

INAA of the Cruz B sample provides additional insight into consumption and economics at Etlatongo, as well as adding two obsidian sources that were not previously identified at Etlatongo: Cruz Negra, Michoacán and Tulancingo, Hidalgo. The data are summarized in [Table 1](#), shown below, while compositional data are detailed in Appendix 1.

Table 1. Cruz B Obsidian Sources Used at Etlatongo						
	Context at Etlatongo (see text for details about contexts)					
Obsidian Source	EA-2 n = 128	Unit 22, Feature 3 n = 37	Unit 1 n = 28	Unit 15 n = 8	Unit 16 n = 6	Total n = 207
Paredón, Puebla	65%	73%	57%	75%	33%	65% (n = 135)
Otumba, México	24%	11%	7%	0%	17%	18% (n = 38)
Guadalupe Victoria, Puebla	8%	8%	0%	25%	17%	8% (n = 16)
Ucareo, Michoacán	2%	0%	25%	0%	33%	5% (n = 11)
Pico de Orizaba, Veracruz	0%	5%	0%	0%	0%	1% (n = 2)
El Chayal, Guatemala	0%	0%	7%	0%	0%	1% (n = 2)
Tulancingo, Hidalgo	0%	3%	0%	0%	0%	0.5% (n = 1)
Ixtepeque, Guatemala	0%	0%	4%	0%	0%	0.5% (n = 1)
Cruz Negra, Michoacán	1%	0%	0%	0%	0%	0.5% (n = 1)

The results of the INAA for the Cruz B sample are quite provocative. Additional obsidian sources are present at Etlatongo that have not been documented at contemporaneous Valley of Oaxaca sites, although those data were gathered nearly 30 years ago and may not be fully comparable (Flannery 1976; Pires-Ferreira 1975). Clearly, ancient villagers at Etlatongo participated in a variety of exchange networks. While most households relied on obsidian from Paredón, which constitutes 65% of the total Cruz B sample, each higher status household had access to at least one source that the others did not. It is noteworthy that the one average household sampled, Unit 15, had access to only two sources – Paredón and Guadalupe Victoria. Even the household represented by Unit 16, with fewer obsidian fragments recovered than Unit 15, had four sources utilized. The other higher status households each had five sources. While the sample from Unit 22, Feature 3 had the only samples from the Pico de Orizaba and Tulancingo sources, the households represented by EA-2 accessed West Mexican sources. In addition to Ucareo, Michoacán, the only archaeological example to this date at MURR of an obsidian fragment from Cruz Negra, Michoacán came from EA-2 (Glascock 2004, personal communication). Additional sources are represented in the strata associated with a possible public structure at Unit 1, where the only fragments from Guatemalan sources – El Chayal and Ixtepeque – appear. No fragments come from Guadalupe Victoria in these Unit 1 deposits. Thus, the results show networks of

individual access to exotic sources beyond those commonly utilized by nearly every household (Paredón and Otumba), where choices reflect negotiations of access both within Etlatongo and in relations with other Early Formative communities.

### ***Additional Early Formative sources from the Mixteca Alta and Adjacent Regions***

A problem with the original pilot study is the lack of context for the results in the Mixteca Alta. I focused on samples from the Nocixtlán Valley as well as regions that may have played a crucial role in trade routes. Obsidian from Cruz A and Cruz B occupations at the Nocixtlán Valley site of Yucuita were sourced. While Cruz B samples were especially desired, only three could be located. Fortunately, an additional 42 samples from Cruz A occupations at Yucuita were located for analysis. In order to understand movement of obsidian into the Nocixtlán Valley, an additional 21 samples were sourced from Rancho Dolores Ortíz, a Cruz A village located approximately 200 km east of Yucuita in the Cuicatlán Cañada. While Yucuita is 25 km closer to a major Formative obsidian source than is Rancho Dolores Ortíz, the Cañada site contained triple the amount of obsidian. It has been hypothesized that Rancho Dolores Ortíz was a central node in this exchange network (Winter 1984). Included with this sample was one additional obsidian fragment from the Mixe area of Oaxaca; the sample was collected from the surface, so it is not possible to determine from which phase of the Formative it pertains. While it was hoped that contemporaneous obsidian samples from the Valley of Oaxaca could be obtained, it appears most of the obsidian from excavations conducted 30 years ago have been misplaced or are simply unavailable.

While more samples from Cruz B deposits in the Mixteca Alta and Cuicatlán Cañada would be desirable, the data clearly show the importance of the Guadalupe Victoria obsidian source in the Mixteca Alta. All Cruz B obsidian from Yucuita is from that source, as are most of the Cruz B samples. The only other obsidian source represented at Yucuita is Pico de Orizaba – a source geographically close to Guadalupe Victoria (see [Figure 1](#)).

The same pattern prevails at Rancho Dolores Ortíz (combined in [Table 2](#) with one obsidian fragment from the Cruz A Mixe site of Zacatepec), with 90% of the obsidian from Guadalupe Victoria. One surprise is the presence at Rancho Dolores Ortíz of Guatemalan obsidian – from El Chayal. This suggests the strategic location of Rancho Dolores Ortíz not only permitted the site to funnel obsidian from the Central Highlands and Veracruz into Oaxaca, but also connected it to exchange networks that trafficked in Guatemalan obsidian. The virtual absence of the major Cruz B obsidian source at Etlatongo – Paredón – at Yucuita and Rancho Dolores Ortíz is significant, and illustrates the dramatic transformations in interregional interaction and social complexity emblematic of the Cruz B phase.

**Table 2. Comparison of Cruz B Obsidian from Etlatongo with Cruz A and Cruz B Sites in the Nochixtlán Valley and Cuicatlán Cañada**

Obsidian Source	Cruz A and Cruz B Villages		
	Etlatongo Cruz B n = 207	Yucuita Cruz A & B n = 45	Rancho Dolores Ortíz; Mixe; Cruz A n = 21
Paredón, Puebla	65%	2%	0%
Otumba, México	24%	0%	0%
Guadalupe Victoria, Puebla	8%	88%	90%
Ucareo, Michoacán	2%	0%	0%
Pico de Orizaba, Veracruz	0%	17%	5%
El Chayal, Guatemala	0%	0%	5%
Tulancingo, Hidalgo	0%	0%	0%
Ixtepeque, Guatemala	0%	0%	0%
Cruz Negra, Michoacán	1%	0%	0%

### ***Diachronic Change***

The initial sample from Etlatongo only focused on Cruz B contexts; I also wanted to understand changes in obsidian procurement through time. The later Yucuita phase represents a time of significant changes in socio-political complexity (Blomster 2004). Obsidian analysis can assess the impact of new urban centers on exchange and procurement economies. I selected all (n = 93) obsidian fragments from Yucuita phase deposits associated with houses in Excavation Area 1 (EA-1) and from a storage pit in Unit 6 (n = 13). In order to place these in a larger context, Late Formative obsidian was sourced from Monte Albán (n = 15), the center of the Zapotec state in the Valley of Oaxaca, and Carrizal (n = 16), located on the Isthmus of Tehuantepec. These data are summarized in [Table 3](#).

The Yucuita phase data show changes in economic patterns during the Late Formative period at Etlatongo. The Paredón source, while still the most important, no longer constitutes over half of all obsidian at Etlatongo. The decreased utilization of the Paredón source, however, is not balanced by increased number of sources utilized; the total number of obsidian sources is one less, eight, than during Cruz B. The sources, however, change; West Mexican sources seem to decline in importance, while two more sources from the Mexican highlands – Pachuca and Zaragoza – become important.

**Table 3. Comparison of Late Formative Obsidian from Etlatongo, Monte Albán, and Carrizal**

Obsidian Source	Late Formative (Yucuita or Monte Albán early I) sites:		
	Etlatongo n = 106	Monte Albán n = 15	Carrizal n = 16
Paredón, Puebla	42%	73%	0%
Otumba, México	29%	7%	0%
Guadalupe Victoria, Puebla	14%	7%	25%
Sierra de Pachuca, Hidalgo	6%	0%	12%
Ucareo, Michoacán	5%	1%	0%
Zaragoza, Puebla	3%	7%	19%
Pico de Orizaba, Veracruz	3%	0%	3%
El Chayal, Guatemala	1%	0%	12%
San Martín Jilotepeque, Guatemala	0%	0%	2%

Comparison with Monte Albán, the center of the emerging Classic Zapotec state in the Valley of Oaxaca, shows a decreased variety of sources. Only five sources are represented in the sample tested by INAA, and of these the Paredón source constitutes the vast majority (73%) of the sample. The nearly total focus on the Paredón source at Monte Albán also contrasts with the obsidian analyzed from Carrizal. This site, located along important Isthmus of Tehuantepec trade routes, contained no examples of the Central Mexican highland sources – Paredón and Otumba – so important at Etlatongo and Monte Albán. Instead, obsidian sources represented are much more evenly divided between six sources, two of which (Chayal and San Martín Jilotepeque) are Guatemalan. West Mexican sources are absent in the Carrizal sample, while the important Guadalupe Victoria source in Puebla is the most frequent (25%). Carrizal was located adjacent to Isthmus trade routes that channeled Guatemala obsidian into the Southern and Central Highlands.

## Conclusion

With the support of FAMSI, 365 obsidian fragments were sourced. Combined with the results of the pilot study, there is now a database of 410 obsidian samples that have been sourced for the Cruz B and Yucuita phases at Oaxaca. These data allow for significant synchronic interpretations at Etlatongo – different access to select obsidian sources – as well as important diachronic patterns. Ancient inhabitants of Etlatongo participated in a variety of exchange networks that brought obsidian from as far away as West México and Guatemala to their houses. Rather than being a "periphery" compared to the Valley of Oaxaca, I argue that Etlatongo was at a level of socio-political complexity similar to that of the largest center in the Oaxaca Valley – San José Mogote.

While the interpretations and conclusions presented in this report will be refined as the database is further analyzed and expanded, this project has generated raw data available for comparative research by scholars investigating questions of political economy and social complexity in Formative Oaxaca and beyond. I envision the data presented in [Appendix 1](#) as relevant to any researcher exploring interregional interaction during the Formative period in Mesoamerica.

## Acknowledgements

In addition to support from the Foundation for the Advancement of Mesoamerican Studies, Inc., (FAMSI), the cost of the current project was partially underwritten by a National Science Foundation grant (BCS-0102325) to MURR, where analysis was supervised by Dr. Michael Glascock. This research could not have been performed without the cooperation and permission of the Instituto Nacional de Antropología e Historia (INAH). I extend my thanks to everyone involved on both the Oaxaca and México City levels in helping me export these samples to MURR. A special thanks is extended to Dr. Marcus Winter in Oaxaca for helping to search for samples from contexts he excavated and sharing them with me. Finally, I wish to thank the many people at San Mateo Etlatongo who have assisted in all stages of the research, plus the many colleagues and friends who have participated in the research or offered advice throughout the project.
